

# Livelihood Admin Module – Product Requirements Document

## 1. Problem Statement

The Livelihood programme provides clean energy solutions to individuals and communities engaged in livelihood activities such as agriculture, animal husbandry, textile and crafts, and resilient micro businesses. These interventions require coordination between platform organisations, vendor organisations, programme teams, field teams, and end users.

Currently, there is a need for a dedicated administrative platform to manage the different entities, users, projects, end users, and project-related workflows involved in the Livelihood programme.

The existing **E4H Management Hub**, developed for the Energy for Health programme, provides a suitable administrative framework for managing similar requirements. However, the Livelihood programme has its own operational context and requires certain modifications to this existing structure.

Therefore, the key problem to be addressed is:

**To provide a centralised administrative module for the Livelihood programme that enables teams to manage organisations, users, roles, end users, projects, and installation-related workflows through a structured system, while leveraging the existing E4H Management Hub as the baseline.**

## 2. Proposed Solution

The proposed solution is to develop a **Livelihood Admin Module** based on the existing **E4H Management Hub** used for the Energy for Health programme.

The core functionality and administrative structure of the E4H Management Hub will be replicated for the Livelihood programme wherever applicable. The existing E4H functionality will therefore serve as the baseline for the Livelihood Admin Module.

Only the **livelihood-specific modifications, additions, or exclusions** will be implemented based on the operational requirements of the Livelihood programme.

The solution will enable the programme team to centrally:

- Create and manage **Platform Organisations**.
- Create and manage **Vendor Organisations**.

- Add and manage users associated with Platform Organisations and Vendor Organisations.
- Assign appropriate roles and access to users.
- Create and manage **End User** details.
- Create and manage **Projects**.
- Schedule projects and associated activities.
- Create and manage installation plans.
- Review, approve, or reject installation plans and reports.
- Support the installation-related workflows defined for the Livelihood programme.

The installation planning and reporting workflow will be implemented in accordance with the **already-approved/submitted PRD for the Livelihood Installation App**, and the Admin Module will provide the corresponding administrative and review functionality required to support that workflow.

### 3. Livelihood Admin Module – Overview

The **Livelihood Admin Module** will act as the central administrative system for managing the digital operations of the Livelihood programme.

Its overall structure and core functionality will be similar to the **E4H Management Hub**. Users familiar with the E4H Management Hub should therefore be able to understand and operate the Livelihood Admin Module with minimal additional learning.

The module will provide administrative capabilities across the following broad areas:

#### 3.1 Organisation Management

The module will enable authorised users to:

- Create and manage Platform Organisations.
- Create and manage Vendor Organisations.
- Maintain organisation-level information required for the Livelihood programme.

#### 3.2 User and Role Management

The module will enable authorised administrators to:

- Add users associated with Platform Organisations.
- Add users associated with Vendor Organisations.

- Maintain user details.
- Assign appropriate roles to users.
- Manage user access based on their organisation and assigned role.

### **3.3 End User Management**

The module will provide the capability to create and manage details of the **End Users** who receive renewable energy solutions under the Livelihood programme.

This is analogous to **Facility Management in the E4H Management Hub**, with the relevant livelihood-specific information replacing or supplementing health-facility-related information.

### **3.4 Project Management**

The module will enable authorised users to:

- Create projects.
- Manage project information.
- Schedule projects.
- Associate relevant organisations, users, end users, and implementation activities with projects.

### **3.5 Installation Plan and Report Management**

The module will support the administrative side of the Livelihood installation workflow, including:

- Creation and management of installation plans.
- Review of installation plans.
- Approval or rejection of installation plans.
- Review of installation-related reports.
- Approval or rejection of reports wherever applicable.

The detailed requirements for the installation workflow will be aligned with the **Livelihood Installation App PRD** and will be covered separately in the relevant requirement section.

### **3.6 Baseline Principle**

For implementation purposes, the following principle will apply throughout this PRD:

**The E4H Management Hub will be treated as the baseline product. Existing E4H functionality will be retained wherever applicable, and this PRD will primarily specify the changes, additions, or exclusions required for the Livelihood programme.**

#### **4. Users, Roles and Responsibilities**

The Livelihood Admin Module will use a role-based access control structure similar to the **E4H Management Hub**. The roles will determine the administrative actions and level of access available to each user.

The role structure is divided into two primary sides:

- **Platform / Organisation side** – users responsible for programme, project, review, and administrative activities.
- **Vendor side** – users responsible for field-level implementation and reporting activities.

The following roles will be available in the Livelihood Admin Module.

##### **4.1 Super Admin**

The **Super Admin** will have the highest level of administrative access within the Livelihood Admin Module and will function similarly to the **Super Admin** in the E4H Management Hub.

##### **Responsibilities**

The Super Admin will be able to:

- Create and manage **Platform Organisations**.
- Create and manage **Vendor Organisations**.
- Add users within Platform Organisations and Vendor Organisations.
- Assign roles to users.
- Manage user access and administrative activities across the platform.
- Perform activities available to the **EndUser Admin**.

The Super Admin will therefore have the ability to perform the complete set of administrative activities required to configure and operate the Livelihood Admin Module.

##### **4.2 Organisation POC**

The **Organisation POC** will be the primary administrative contact for a Platform Organisation.

### **Responsibilities**

The Organisation POC will be able to:

- Manage users belonging to their organisation, subject to their assigned permissions.
- Add and manage organisation-side roles.
- Assign appropriate roles to organisation users.

The Organisation POC will have access to the organisation-side functionality of the organisation he is part of

### **4.3 Vendor POC**

The **Vendor POC** will be the primary administrative contact for a Vendor Organisation.

### **Responsibilities**

The Vendor POC will be able to:

- Manage users belonging to their Vendor Organisation.
- Add and manage vendor-side roles.
- Assign appropriate roles to vendor users.

The Vendor POC will primarily be responsible for ensuring that the required vendor users are created and assigned appropriate access for field implementation activities.

## **5. Organisation-Side Roles**

The following roles will be available under a Platform Organisation.

| <b>Role</b>             | <b>Primary Responsibility</b>                                                                                                                                                                                                                        |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Organisation POC</b> | Overall organisation-level administration and management of organisation-side users and roles.                                                                                                                                                       |
| <b>Program POC</b>      | Overall view access to all the tickets, managing tickets assigned to Program POC, handling out-of-scope issues, reassigning out-of-scope issues and any other functionality assigned to program POC as defined in the Issue resolution(O&M) platform |

| Role                         | Primary Responsibility                                                                                                                 |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>Installation Reviewer</b> | Review and take appropriate action on installation-related plans/reports submitted through the system.                                 |
| <b>AMC Reviewer</b>          | Review and take appropriate action on AMC-related reports and activities.                                                              |
| <b>Project Manager</b>       | Manage and coordinate project-level activities, including project execution, Project and field plan creation and associated workflows. |
| <b>EndUser Admin</b>         | Create and manage end users, similar to facilities management in the E4H ecosystem.                                                    |

This role is intended to provide decentralised user management, allowing the organisation to manage its users without requiring every user-management activity to be performed by the Super Admin.

## 6. Vendor-Side Roles

The following roles will be available under a Vendor Organisation.

| Role                   | Primary Responsibility                                                             |
|------------------------|------------------------------------------------------------------------------------|
| <b>Vendor POC</b>      | Overall vendor-level administration and management of vendor-side users and roles. |
| <b>Field Staff</b>     | Complete and submit installation-related reports from the field.                   |
| <b>AMC Field Staff</b> | Perform field-level AMC activities and complete/submit AMC-related reports.        |

### Field Staff

The **Field Staff** will be responsible for field-level installation reporting.

The role will primarily have access to:

- View assigned installation activities.
- Fill installation reports.
- Submit completed installation reports.

The Field Staff will **not have administrative access** to create or manage organisations, users, projects, or other administrative configurations unless separately assigned an appropriate role.

## AMC Field Staff

The **AMC Field Staff** will be responsible for carrying out AMC-related field activities and submitting the required AMC reports through the relevant workflow.

Their access will be limited to the AMC activities assigned to them and the functionality required to complete and submit those activities.

## 7. Screens, Views & Display Requirements

The Livelihood Admin Module will follow the existing **E4H Management Hub** structure and user experience wherever applicable. The screens, navigation, layout, and existing interactions will remain similar to Health unless explicitly modified below.

The **visual theme/colour scheme** will follow the **Setu4Livelihood Issue Management Platform** instead of the E4H Health theme.

The collapsible sidebar and navigation back to Home will remain similar to Health.

### 7.1 Super Admin – Home

When a **Super Admin** logs in, the following management options will be available:

- **Manage Platform Organisation**
- **Manage Vendor Organisation**
- **Manage End Users**

The Super Admin will also have the ability to perform **EndUser Admin activities**, in addition to the activities available to the Super Admin role.

### 7.2 Manage Platform Organisation

Selecting **Manage Platform Organisation** will open a screen similar to the corresponding screen in the E4H Management Hub.

#### Screen Elements

The screen will contain:

- **Add Platform Organisation** button.
- **Search** functionality to search for an organisation.
- List of created Platform Organisations.

- Existing E4H Management Hub functionality for navigation/back to Home and collapsible sidebar.

## Platform Organisation List

The list will display:

### Field

Organization Name

Organization Code

Status

PoC Name

**Organisation Sub Type will not be displayed**, as the field is removed for Livelihood.

**Organisation Code** will be automatically generated by the system, similar to the E4H Management Hub.

## 7.3 Add Platform Organisation

Clicking **Add Platform Organisation** will open the organisation creation form.

### Fields

| Field                 | Requirement                                                                       |
|-----------------------|-----------------------------------------------------------------------------------|
| Organization Name     | <b>Compulsory</b>                                                                 |
| Organization Type     | Automatically set to <b>Platform Organisation</b> ; user input not required       |
| Organization Sub Type | <b>Removed</b>                                                                    |
| Status                | <b>Compulsory</b> ; Active by default and can subsequently be changed to Inactive |
| PoC Name              | <b>Compulsory</b>                                                                 |
| PoC Contact           | <b>Compulsory</b>                                                                 |
| PoC Email             | Optional                                                                          |

| Field        | Requirement       |
|--------------|-------------------|
| PoC Username | <b>Compulsory</b> |
| PoC Password | <b>Compulsory</b> |

The **Organisation Code** will be automatically generated by the system.

### **Automatic Organisation POC Creation**

On creation of the Platform Organisation:

- The provided PoC user will automatically be created as an **Organisation POC**.
- The Organisation POC role will automatically be assigned to that user.
- The user will receive the functionality associated with the Organisation POC role.
- The created role/user details will be available for viewing and editing from the organisation details page.

### **7.4 Platform Organisation Details**

Clicking an existing Platform Organisation will open its **Organisation Details** page, similar to Health.

The page will display the organisation details and provide the ability to manage users.

#### **User Management**

The page will include:

- **Add User** option.
- List of users associated with the organisation.
- Ability to view and edit user/role details.

The user list will display:

| Field    |
|----------|
| Name     |
| Username |
| Password |
| Contact  |
| Email    |

## Field

Roles

Actions

Under **Actions**, the available actions will include:

- Edit
- Delete

Password editing and assigning will be done through the admin module itself

The **Add User** flow will follow the existing Health functionality for user details and inputs.

The only change will be that the **role selection will contain the Livelihood Platform/Organisation-side roles** defined for this module.

Applicable organisation-side roles are:

- Organisation POC
- Program POC
- Installation Reviewer
- AMC Reviewer
- Project Manager
- End User Admin

## 7.5 Manage Vendor Organisation

Selecting **Manage Vendor Organisation** will open a screen similar to the Vendor Organisation screen in the E4H Management Hub.

### Screen Elements

The screen will contain:

- **Add Vendor Organisation** button.
- Search functionality.
- List of created Vendor Organisations.
- Existing Health functionality for navigation/back to Home and collapsible sidebar.

### Vendor Organisation List

The list will display:

**Field**

Organization Name

Organization Code

Status

PoC Name

**Organisation Sub Type will be removed and will not be displayed.**

**Organisation Code** will be automatically generated by the system, similar to Health.

## 7.6 Add Vendor Organisation

Clicking **Add Vendor Organisation** will open the vendor organisation creation form.

**Fields**

| Field                 | Requirement                                                                       |
|-----------------------|-----------------------------------------------------------------------------------|
| Organization Name     | <b>Compulsory</b>                                                                 |
| Organization Type     | Automatically set to <b>Vendor Organisation</b> ; user input not required         |
| Organization Sub Type | <b>Removed</b>                                                                    |
| Status                | <b>Compulsory</b> ; Active by default and can subsequently be changed to Inactive |
| PoC Name              | <b>Compulsory</b>                                                                 |
| PoC Contact           | <b>Compulsory</b>                                                                 |
| PoC Email             | Optional                                                                          |
| PoC Username          | <b>Compulsory</b>                                                                 |
| PoC Password          | <b>Compulsory</b>                                                                 |

The **Organisation Code** will be automatically generated by the system.

### Automatic Vendor POC Creation

On creation of the Vendor Organisation:

- The provided PoC user will automatically be created as a **Vendor POC**.
- The Vendor POC role will automatically be assigned to that user.
- The user will receive the functionality associated with the Vendor POC role.
- The created role/user details will be available for viewing and editing from the Vendor Organisation details page.

## 7.7 Vendor Organisation Details

Clicking an existing Vendor Organisation will open the **Vendor Organisation Details** page, similar to Health.

The page will display the vendor organisation details and provide user management functionality.

### User Management

The page will include:

- **Add User** option.
- List of users associated with the Vendor Organisation.
- User details and assigned roles.
- Ability to edit user details/roles.

The user detail view will follow the existing Health structure and display the available user information with an **Edit and delete** option.

**One addition will be a password option, which will be compulsory and which will be an input field right after username. Password management will be done through the Admin module itself**

The **Add User** flow will also follow the existing Health user creation flow.

### Role Assignment

During user creation/editing, the role selection will only display roles applicable to the **Vendor Organisation**.

Available Vendor Organisation roles are:

- Vendor POC
- Field Staff

- AMC Field Staff

No organisation-side roles will be available for assignment to Vendor Organisation users.

## 7.8 End User Admin and Boundary

In the E4H Health setup, facility-related user management is handled through the relevant facility administration structure.

For Livelihood:

- **End User Admin** will be available as an organisation-side role for managing users.
- The **Super Admin will also be able to perform End User Admin activities.**

The detailed functionality, boundaries and access rules for End User Admin and End User management will be defined in the subsequent **End User Admin & Boundary Management** section.

## 8. End User Admin & End User Management

The **End User Admin** functionality in the Livelihood Admin Module will replace the facility administration functionality used in the E4H Health setup.

Unlike Health, where State, District and Block boundaries are manually added, the Livelihood Admin Module will use a **pre-ingested master dataset of all States, Districts and Blocks**. This will eliminate the need for repeated manual boundary creation and reduce errors while entering location information.

**The JSON file provided for this requirement can be used as the source for the initial ingestion.** Alternatively, Engineering may use another credible and reliable source for the State, District and Block master data.

The same End User Admin functionality described below will be available to both:

- **Super Admin**
- **End User Admin**

For the Super Admin, this functionality will be available through an **Add/Manage Users** option. For an End User Admin, this will be the **only available functionality** within the Admin Module.

### 8.1 Add/Manage Users

When the Super Admin or End User Admin selects **Add/Manage Users**, the system will open the End User management screen.

The screen will have two options at the top:

- **Add User**
- **Bulk Add**

The screen will also provide the same location-based filtering functionality available in the Health facility addition screen on left side.

### **Filters**

The following filters will be available:

- State
- District
- Block

The **End User** search option will be available, which will support searching using:

- End User Name
- End User Phone Number

This search will be independent of the filter and will work within the filter range when filters are applied.

### **End User List**

The list will display:

#### **Field**

End User ID(System Auto-Generated)

End User Name

State

District

Block

End User Phone Number

## **8.2 End User Details**

Clicking an existing End User will open the End User details page.

The admin will be able to:

- View End User details.
- Edit End User details.
- View assets associated with the End User.
- View vendors associated with these details and change these vendors – The user should be able to select a different vendor for each asset under each end user from the list of all vendors. The same will get reflected in the issue reporting platform(Setu4Livelihood) and will be considered as a mapped vendor. Please refer the vendor management section for further details
- View asset details.
- View installation report details.
- View relevant activity associated with the End User.
- View AMC-related information associated with the End User when the AMC functionality is introduced.

The overall view and functionality will follow the corresponding facility-level view available in the E4H Health system, adapted for Livelihood End Users.

### 8.2.1 Vendor Management View

Reference Screen - [VendorManagamentScreen.png](#)

Add a new **Vendor Management** view alongside the existing **Asset** and **AMC** views in the End User details screen.

On opening this view, display all **asset groups** associated with the End User along with the currently mapped vendor. For demonstration, asset groups such as **Solar**, **Roti Rolling Machine**, and **Rice Huller** can be displayed.

The mapped vendor should be editable. Clicking on the vendor name should open a dropdown containing the available vendors, allowing the user to **select a different vendor for that asset group.**

The **Save** button should remain inactive by default and become active only when at least one vendor mapping is changed. On clicking **Save**, a pop-up should appear asking for confirmation of the changes with a Yes and Cancel button. Clicking on Yes, all modified vendor mappings should be saved successfully.

### 8.3 Add End User

Clicking **Add User** will open the End User creation form.

The following fields will be available:

| Field             | Requirement                                                                                                                                                                                                                                                |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State             | <b>Compulsory</b>                                                                                                                                                                                                                                          |
| District          | <b>Compulsory</b>                                                                                                                                                                                                                                          |
| Block             | <b>Compulsory</b>                                                                                                                                                                                                                                          |
| End User Name     | <b>Compulsory</b>                                                                                                                                                                                                                                          |
| End User Sector   | <b>Compulsory. Options</b> – Agriculture, Animal Husbandry, Built Environment, Resilient Micro Business, Textiles & Craft.                                                                                                                                 |

| Longitude         | Optional                                                                                                                                                                                                                                                   |

#### Location Selection

State, District and Block will be selected from the **pre-ingested master dataset**.

The District options will be based on the selected State, and the Block options will be based on the selected District.

## **Is Operational**

The End User will be marked as **Operational = Yes** by default.

The value can subsequently be changed to **No** by editing the End User details.

## **Is O&M Ready**

The **Is O&M Ready** field will determine whether the End User should be displayed in the **Issue Reporting Platform**.

## **8.4 Bulk Add End Users**

The **Bulk Add** functionality will follow the same mechanism as the Health **Bulk Add Facility** functionality.

The system will provide a predefined template containing the End User fields specified in the Add End User form.

The template will contain the following fields:

- State
- District
- Block
- End User Name
- End User Sector
- End User Contact
- End User Password (Which can be left blank, and the system will generate automatically by using the above-mentioned logic)
- End User Email
- Is Operational
- Is O&M Ready
- Latitude
- Longitude

The compulsory/optional requirements for these fields will remain the same as defined in the **Add End User** functionality.

## **Bulk Upload Flow**

1. Admin selects **Bulk Add**.
2. Admin downloads/uses the provided template.
3. Admin fills the required End User details.
4. Admin uploads the completed template.
5. The system displays a confirmation message:

**“Are you sure you want to upload these End Users and their details to the system?”**

6. On confirmation, the system validates the uploaded data.

### **Successful Upload**

If all required values are present and the uploaded data is valid:

- The system will upload all End Users.
- The End Users will become available in the End User management list.

### **Upload Error**

If the uploaded file contains missing compulsory values or other validation errors:

- The system will not complete the upload.
- The system will provide an error indication.
- The admin will be able to **download the error file**.
- The downloaded file will indicate the errors against the relevant End User records so that the admin can correct and re-upload the data.

## **8.5 Boundary Data Management**

Unlike the E4H Health Admin Module, the Livelihood Admin Module will **not provide a manual boundary addition functionality**.

The following master data will be pre-ingested into the system:

### **State → District → Block**

This master data will be available for selection throughout the relevant Livelihood workflows and will not need to be repeatedly added by Admin users.

The purpose of this approach is to:

- Avoid repeated manual boundary creation.
- Reduce manual data-entry errors.

- Maintain consistency in State, District and Block information across the platform.
